

Shopynn

Product Features Guide

What each capability does | Real-world problems it solves | 2026-09-24

Shopynn is a multi-tenant commerce platform for retailers - especially Ghanaian SMEs - combining point of sale, inventory, purchasing, online orders, MoMo payments, expenses, staffing controls, and reporting across web and mobile. This document inventories product features as shipped in the Shopynn monorepo (API, admin web, merchant mobile, marketing site, and print agent).

How to read each entry: Feature name / What it does / Real-world issue addressed.

Platform overview

Shopynn commerce platform

Cloud POS, inventory, and operations suite for Ghanaian retailers - web admin, mobile app, marketing site, API, and local thermal print agent.

Shops still run on notebooks, WhatsApp, and disconnected Excel sheets; stock, cash, and credit get out of sync across counters and branches.

Dashboard

Overview / Analytics

At-a-glance business health: sales pulse, key metrics, and shortcuts into daily work.

Owners cannot see whether the day is on track without calling every cashier or waiting for end-of-day tallies.

Reports

Operational and financial report catalog with date presets, detail tables, and CSV/PDF/XLSX export where entitled.

Accountants and owners need auditable period reports (sales, stock, expenses) without rebuilding spreadsheets every month.

Trading - Sales

New Sale (POS)

Fast checkout: cart, discounts, cash/MoMo/credit, receipts, multi-store awareness, offline-aware flows.

Queues form when checkout is slow; lost sales when power/network blips; cash vs MoMo mix is hard to reconcile.

Pending Sales

Review and approve sales that need a second pair of eyes before they finalize.

Junior staff mistakes (wrong price, credit without approval) leak margin before anyone notices.

Pending MoMo

Parked POS MoMo charges: check status, resume cart, complete sale, or handle abandoned attempts.

Customer is still approving MoMo while the next buyer is waiting - cashiers need to serve others without losing the payment.

POS MoMo payments

Ledger of MoMo gateway charges for counter sales (paid / pending / failed) with sale invoice links.

Disputes ("I paid") and daily MoMo reconciliation need a payment history, not only a list of finished sales.

Sales List

Searchable history of completed sales with filters, dates, and drill-down to sale detail / resend invoice.

Customers return for receipt reprints; managers need to find a sale by invoice, date, or attendant.

Sales Returns

Record returns against prior sales with stock put-back and refund method constraints.

Without a return trail, stock and cash disagree after refunds and exchanges.

Balances owed / credit

Track unpaid and partial sales (customer credit) and collect later.

Neighborhood shops sell on trust; without a ledger, who owes what is tribal knowledge that walks out with staff.

Trading - Purchasing

New Purchase

Receive stock from suppliers with costs, quantities, and payment capture.

Goods arrive without a digital record - cost and quantity never update inventory correctly.

Purchases List

History of purchase receipts with filters and supplier context.

Supplier disputes and landed-cost questions need a clear trail of what was received and when.

Purchase Orders

Create, send, and receive against POs before goods land.

Ad-hoc buying causes overstock, stockouts, and no accountability for what was ordered vs delivered.

Trading - Online

Online / Store Orders

Accept and fulfil customer online orders linked to the same inventory.

WhatsApp-only ordering loses orders, double-sells stock, and has no fulfilment status.

Order Payments

Payment records for online orders (card, MoMo, cash markers) with receipts and status filters.

Online payments fail or pend; staff need a clear paid vs unpaid queue separate from POS.

Order Settlements

Digital order revenue, payout profile (MoMo/bank), and withdrawal requests to merchant accounts.

Platform-collected online money must settle to the merchant without opaque transfer processes.

Inventory

Items / Products

Product catalog: SKU, prices, cost, units, images, stock levels, reorder points.

Wrong prices at the till and unknown stock levels cause undercharging and surprise stockouts.

Categories

Organize products into categories for browsing and reporting.

Large catalogs become unusable without structure cashiers and buyers can navigate.

Transfers

Move stock between branches/warehouses with send/receive confirmation.

Multi-branch shops "move" stock verbally; one branch shows stock that already left.

Adjustments

Correct quantities for damage, theft, found stock, or counting errors with a reason trail.

Physical stock never matches the system without a controlled way to write quantities up/down.

Stock count / Audit

Guided counts that produce adjustments from counted vs system quantity.

Annual or weekly stock takes on paper never get posted back into the books.

Reorder List

Surface items at or below reorder level so buying is proactive.

Bestsellers run out because nobody monitors minimums until a customer asks.

Expiring List

Highlight near-expiry items for markdown or return decisions.

Perishables and dated goods expire unnoticed, turning into dead stock and loss.

What i

Real-v

Product Transactions

Movement history for a product (sales in/out, purchases, adjustments).

When quantity looks wrong, staff need the full story of every movement - not a single number.

People

Customers

Customer master data, purchase history, payments, and credit context.

Repeat buyers and credit customers become anonymous; loyalty and collections suffer.

Users / Staff

Create staff accounts, assign warehouses, disable leavers.

Shared logins hide who discounted or voided; leavers retain access.

Roles & permissions

Role-based access control so cashiers, managers, and accountants see only what they need.

Everyone-as-admin leads to fraud risk and accidental destructive changes.

Expenses

Expenses

Record business costs (rent, utilities, transport) with categories and dates.

Profit looks fine until cash is gone - operating costs lived only in the owner's head.

Setups

Go live checklist

Guided path from empty shop to first sale (store, products, receipt, sell).

New merchants stall after signup because setup feels overwhelming.

Locations / Towns

Geographic locations used for stores and logistics context.

Multi-town chains need consistent place names for branches and delivery.

Stores / Branches

Warehouses/branches with stock separation and optional multi-store access.

One inventory pool for many shops causes wrong stock and wrong reporting per branch.

Suppliers

Supplier directory and supply history (including supplies list).

Buying from memory loses contact details, terms, and what each supplier typically provides.

Invoice & Receipt

Company receipt details, invoice numbering, and local thermal print-agent settings.

Customers expect branded receipts; Ghana shops rely on affordable thermal printers at the counter.

Export products

Download live product catalog as CSV (name, SKU, prices, stock, reorder).

Owners need catalog copies for Excel analysis, auditors, or migration - without a fake full-backup promise.

Admin

Notifications

Push/in-app alerts for MoMo, low stock, online orders, daily summaries; preference controls.

Critical events happen while the owner is offline; without alerts, problems age overnight.

Mobile app

Merchant mobile POS & ops

React Native app covering sales, purchases, inventory, More-menu setups, and on-the-go reporting.

Owners and attendants are not always at a desk - operations must work from a phone on the shop floor.

Offline / local resilience

Patterns for continuing work when connectivity is weak (with clear limits for MoMo which needs network).

Ghana retail often has intermittent data; a total freeze at checkout costs real revenue.

Print

Local ESC/POS print agent

Small local service that receives print jobs from web/mobile for thermal receipt printers.

Browsers cannot talk to USB thermal printers directly; shops need a reliable local bridge.

Billing

Subscriptions & plans

Starter / Business / Scale (and Enterprise) plans with feature entitlements and MoMo checkout for subscription.

SaaS must meter advanced features (multi-branch, online orders, exports) while remaining affordable for SMEs.

Feature upgrade gates

Locked nav items and upgrade screens when a plan lacks a feature.

Merchants discover value gradually; soft locks educate without hard crashes.

Customer portal

For You / Cart / Checkout / My Orders

End-customer ordering experience against a merchant storefront inventory.

Customers want to order without calling; merchants want demand without building a custom ecommerce site.

Platform admin

Merchants / agents

Partner onboarding, merchant directory, and commission-oriented tools for growth partners.

Scaling distribution needs agents who onboard shops without engineering involved per signup.

Tenant directory

All businesses, subscription status, and admin oversight.

Platform operators need support and billing visibility across every tenant.

Billing catalog

Plans, fees, and add-on prices maintained centrally.

Price changes and packaging must not require a full redeploy of marketing copy alone.

Marketing ops

Newsletter, broadcasts, contact requests, site chat tooling for the public Shopynn brand.

Inbound leads and support from the marketing site need an owner inside the admin product.

Security & compliance

Auth, tenancy, audit logs

Tenant-isolated data, session auth, and audit trails on sensitive actions (entitlement-gated).

Multi-tenant SaaS must prevent cross-shop data leaks and provide accountability after incidents.

Notes

- Availability depends on subscription plan entitlements and role permissions.
- Pending MoMo is the live park/resume queue; POS MoMo payments is the historical ledger.
- Product CSV export is catalog-only - full business restore relies on platform database backups.
- This guide reflects product intent in the codebase as of the generation date and may evolve with releases.
